Communication Critical to Cooling Water Treatment Program

A cooling water treatment program is only as good as the cooperation and communication between the water treatment representative and the engineering and maintenance personnel. The most finely conceived and technologically advanced program will not provide the desired results if the water treatment rep and the facility engineer do not communicate effectively.

GLOSSARY

OF TERMS

A key to this communication is a mutual understanding of the terms and terminology used in cooling water service reports and laboratory water and deposit analysis reports.

The attached Cooling Water Treatment Glossary of Terms will help facilitate effective communication between water treaters and cooling system engineers and managers.
